In order to select the correct S-cam part number, you must know the following information.

- ① Application: Steer, Drive or Trailer
Make of axle manufacturer
Suspension model when noted
- ② Cam length: Measurement from under cam head to beginning of lock ring groove at camshaft tip. See dimension A on application specific pages.
- ③ Spline diameter and number of splines. (10, 24, 28 or 37)
- ④ Diameter of camshaft at spider.
- ⑤ Diameter of camshaft at camshaft tip.
- ⑥ Length of spider bushing bearing journal from under cam head to beginning of lock ring groove. See dimension B on application specific pages.
- ⑦ Length of spider bushing bearing journal from under cam head to beginning of second lock ring groove if applicable. See dimension C on application specific pages.
- ⑧ Cam head style (see below).

How to use this Quick Identification Guide

1. Measure camshaft length. Measure from under the cam head to the beginning of the lock ring groove (as illustrated on page 7).
2. Locate camshaft length in the Camshaft Quick Identification Guide. Camshafts are listed in order of length, from shortest to longest.
3. After finding camshafts in the Cam Length column, determine camshaft head style, using the Head Styles chart and head width dimensions.
4. Narrow your final selection by Diameter at Spline End and Number of Splines, Diameter at Spider and any other information listed.

These graphics are for identification purposes only. Dimensions in actual camshafts may vary slightly.

For Spicer 12 1/4" Brake S-Camshafts

New Style Cam (1 1/2" Roller) Roller Part Number 32-1427

Head Marking: 0794L & 0794R
(as of July, 1994)

Old Style Cam (1 1/4" Roller) Roller Part Number 32-1428

Head Marking: M12L & M12R

The old style cam has been discontinued for all new production 12 1/4" brake assemblies. Effective August, 1994, only new-style cams are available for service.

IMPORTANT SERVICE GUIDELINES

Please note the following guidelines when using the new-style S-cam in service:

This design change affects only the S-cam and rollers. The use of the new-style S-cam requires the use of a 1.50" diameter roller. Check to be sure the roller being used is the proper diameter.

NOTICE: The new S-cam should **NOT** be used in conjunction with an old-style S-cam on the same trailer axle. New-style S-cams **MUST** be used in both sets of brake assemblies on the trailer axle. The rate of brake application is different from the old-style and new-style S-cams. If the two styles of S-cams are mixed on one trailer axle, one brake may apply sooner than the other, which could result in premature wear and uneven application of brakes which requires prompt service.

NOTICE: The new-style S-cam should **NOT** be used with cast 12 1/4" brake shoes. The cast brake shoes require the use of the old-style S-cam. S-cam service on cast brake shoes requires changing the brake shoes to fabricated tapered lining brake shoes using the new-style S-cam. Failure to change the brake shoe when using the new-style S-cam will result in a failure of the S-cam to function properly and could also cause uneven application of brakes which requires prompt service.

With the fleet requiring and using extended service brake systems, the traditional cam and bushing are failing before the extended service brake lining wears out. The use of a cam enclosure extends the life of the camshaft and its related components to match the life of the extended service brake lining.

All cam enclosures from Spicer are designed to offer superior bearing surfaces for the camshaft. The oil-impregnated bushings are standard and are superior to the soft steel bearing surfaces. The oil-impregnated design reduces wear and increases the life of the camshaft.

Features and Benefits of Spicer Camshaft Enclosures:

Oil-Impregnated Bushing – reduces wear on the camshaft due to galling.

Enclosure Holds A Large Amount of Grease – that can flow more easily to the bearing surfaces, thus extend the life of the camshaft journal and bushings.

Grease Filled Enclosure – extends your maintenance intervals and reduces the likelihood of premature failure from contamination.

Centrally Located Grease Fitting – makes it easier to lube and improves serviceability

ABS: Anti-Lock Braking System

Actuator: A device which physically initiates the mechanical motion of a brake system component.

Air Disc Brakes (ADB): Air-actuated brakes, which upon application, employ a caliper to clamp two brake pads against a rotor. Air discs, compared with drum-type brakes, have superior ability to resist fade.

AL Factor: A mathematical expression of the brake chamber and slack adjuster combination. "A" equals the effective area, in square inches, of the brake chamber diaphragm. "L" equals the effective length, in inches, of the slack adjuster. For example, 30 (air chamber) x 6 (slack adjuster) = 180AL Factor.

Anchor Pin: A pin or pins inserted in the brake spider to which the brake shoes attach and pivot upon.

Anti-compounding: A system that prevents application of service brakes from compounding (adding) to the force exerted by parking brakes. Functionally, this guards against brake drum cracking, brake shoe and brake lining damage.

Anti-Lock: Optional on trailers until March 1, 1998, a safety oriented system which senses wheel rotation (at one or more axles) during braking and cycles the brakes to prevent wheel lockup.

ASA: Automatic slack adjuster

ATA: American Trucking Association

ATC: Automatic traction control

BBW: Brake by wire

BCN: Brake certification notice

Bell-Mounted Drum: Drum with variation of inner diameter (i.e., greater at open end), preventing full contact with brake linings.

Blue Drum: Brake drum with friction surface blued from high temperature. High temperature may result, for example, from dragging of brakes caused by weak return springs. Blue drum also may result from lack of brake balance.

Brake Block: Friction material or lining attached to brake shoe.

Brake Chamber Diaphragm: A device within the brake chamber that converts air pressure to mechanical force via a push rod.

Brake Drag: Failure of one or more brakes to release immediately and/or completely after driver removes his foot from the brake treadle. Constant drag, unrelated to a brake application, also can exist.

Brake Fade: Brake fade results from a reduction in friction between linings and drums caused by exposure to water, dragging brakes on a down-grade or over-adjusted brakes resulting in an over-heated brake drum. Heat fade occurs when linings overheat and become less aggressive. Gradual and predictable fade is desirable as a warning. (Silver and Yellow will glaze if not burnished.)

Burnish: The conditioning or seasoning of a brake lining by wear and temperature via a test procedure or in-service operation.

Caliper: In an air disc brake system, the clamping device to which the friction material is attached. When actuated, the caliper applies braking force to both sides of the rotor.

Cam Base Circle Radius: The perpendicular distance from the center of the s-cam to the vector defined by the center of the cam roller and the intersection of the cam roller with the s-cam profile. Most CBCR are designed to be at or near 1/2 inch.

Clevis pin: Pin connecting the arm of slack adjuster to a brake chamber push rod yoke.

CMVSS: Canadian Motor Vehicle Safety Standard

Coefficient of Friction: Developed by Friction Materials Standards Institute, a double-letter code printed on the edge of a brake block to designate its range of aggressiveness. (Example: EE, FF, GG, FG)

Cracked Drum: Brake drum cracked all the way through by excessive heat build-up (perhaps signifying inadequate drum weight and/or driver abuse) and/or resurfacing of a drum beyond the manufacturer's limit.

CTI: Central tire inflation

Dual Brake System: Mandated by FMVSS 121, the use of a dual air system (primary and secondary) in order to retain braking ability in the event one system fails.

Dust Shield: A plate made of metal or polyethylene that is mounted behind a brake drum to minimize the entry of dirt and road splash.

EBS: Electronic braking system

ECU: Electronic control unit

Edge Code: The information found the edge of a brake block. Spicer friction edge coding includes the type of friction and the coefficient of friction.

Emergency Brake System: Not a separate system, emergency braking (in event of air loss) involves various portions of the parking and service brake systems.

Engine Brake: An optional device that converts a diesel engine into a power-absorbing air compressor to slow a vehicle on downgrades.

ES: Extended Service, Eaton's term for brake design using thicker than standard lining.

ESII: Eaton's redesigned Extended Service brake shoe, introduced in 1996. It employs a new Hot Staked manufacturing process, redesigned retaining springs, lighter weight and elimination of the tabs from the previous design table.

Exhaust Brake: An optional device that uses engine exhaust back pressure to slow a vehicle on downgrades.

FC: Fast Change, Spicer's term for brake design with an open anchor pin rib. Interchanges with Rockwell Q design.

FCII: Spicer's redesigned 12-1/4 Fast Change brake shoe, introduced in 1996. It includes a redesigned table, thicker rib material, an improved welding process, and standardization of brake hardware components.

FMSI: Friction Materials Standards Institute

FMVSS: Federal Motor Vehicle Safety Standard

Foundation Brake System: A term inclusive of mechanical components involved in mechanically providing braking force: brake chambers, slack adjusters, brake drums, brake shoe assemblies.

FT: Fabricated, Tapered, Spicer's term for brake design with a closed anchor pin rib. Interchanges with Rockwell P design.

GAW: Gross axle weight

GAWR: Gross Axle Weight Rating, a rating in pounds of brake lining material, or axle carrying capacity.

GCW: Gross combination weight: the total weight carrying capacity of a combination vehicle as determined by axle ratings.

GCWR: Gross combination weight rating

Grease-Stained Drum: A brake drum with discoloration of the friction surface caused by, for example, improper greasing of brake camshaft.

GVW: Gross vehicle weight: the total weight carrying capacity of one vehicle, (such as a straight truck, bus, tractor or trailer) as determined by axle ratings.

GVWR: Gross vehicle weight rating

HA: Suffix used to denote brake shoes used on axles produced by Spicer's Heavy Axle & Brake Division.

HDBMC: Heavy Duty Brake Manufacturer's Council

Heat-Checked Drums: A brake drum with a pattern of hard, slightly raised, dark spots on its friction surface. Caused by localized overheating and sudden cooling. Those spots should be ground off to prevent drum cracking, uneven lining wear and loss of braking efficiency. If spots cannot be removed, the drum should be discarded.

Lining Growth: Permanent swelling of brake linings due to heat exposure.

Lining Number : Numbers shown are FMSI (Friction Materials Standards Institute) standards and fit the corresponding brake shoe core.

NHTSA: National Highway Transportation Safety Administration

Out-Of-Round Drum: A brake drum with variations in its inner diameter, causing reduced braking efficiency and excessive wear on one side of the brake linings. An out-of-round drum often can be machined, within manufacturer's limits, to restore concentricity.

Over-Sized Drum: This refers to a brake drum having an inner diameter greater than the discard diameter marked on the drum by its manufacturer.

P Brake: Rockwell's term for brake design with a closed anchor pin rib. Interchanges with Spicer FT design.

PM: Preventive maintenance

Polished Drums: A brake drum with a friction surface polished to a mirror-like finish by unsuitable brake linings. Remove gloss from drum with eighty grit emery cloth.

Push Rod: A rod, protruding from a brake chamber, which is connected to the arm of a slack adjuster via a clevis pin.

Q Brake: Quick-change, Rockwell's term for brake design with an open anchor pin rib. Interchanges with Spicer FC design.

Q Plus: Rockwell's term for a quick-change design brake shoe using thicker than standard lining.

R12: Pilot control air valve with quick dump

R14: Pilot control air valve with quick dump and anti-compounding

REB: Eaton's new 15" design Reduced Envelope Brake.

Replace-A-Brake: Spicer's term for a kit to service one brake assembly. It includes two new lined brake shoes and the necessary anchor pins, rollers, springs, etc.

Retarder: Auxiliary brake device: engine brake, exhaust brake, hydraulic retarder or electric retarder.

Return Springs: Springs which retract brake shoes upon release of the brake actuator valve.

RFI: Radio frequency interference

Roll Over: A term denoting that an s-cam has traveled beyond its designed stopping position during brake application.

RP: Recommended practice

SAE: Society of Automotive Engineers

SAP: Single Anchor Pin, Eaton's term for brake design utilizing one non-replaceable anchor pin per brake assembly.

S-cam Brake: A type of brake where mechanically induced rotation of an S shaped cam forces brake linings against the brake drum.

Scored Drum: Brake drum with a grooved friction surface, resulting in excessive lining wear. Severe scoring requires that a drum be machined, within manufacturer's limits, before replacing the linings.

Service Brakes: As opposed to parking brakes, that portion of the brake system used for normal brake applications.

Slack Adjuster: A lever, connecting the brake push rod with the foundation brake camshaft, which provides torque to rotate the brake camshaft when the brake treadle is depressed. Used only on cam-actuated brakes, it also provides a means of adjusting clearance between the brake shoes and the drum to compensate for lining wear. Some models are automatic, requiring proper installation procedures and requiring periodic inspection to insure proper functioning. Manual slack adjusters require proper installation and manual adjustment at maintenance intervals.

SLR: Static loaded radius

Spring Brake: Generally refers to a tandem chamber actuator that incorporates an air-applied service brake chamber or an air-released/spring applied parking or emergency brake chamber. Spring brakes apply upon sudden air loss (emergency mode) or activation of a dash-mounted parking brake control. Spring brakes remain applied until that chamber is recharged or the spring is manually compressed or caged. The spring portion often is referred to as the piggyback. Some spring brake actuators do not incorporate a service air chamber and are solely parking and emergency brakes. For example, some parking brakes are applied by air pressure and subsequently held mechanically by a pawl which drops into a notch on the brake chamber push rod.

Stroke: Refers to a total distance traveled by a brake chamber push rod or slack adjuster arm during brake application.

Supply Tank: The air reservoir immediately downstream of the air compressor.

T Brake: Rockwell's term for a front brake shoe design using a single web with a closed anchor pin end.

Threaded Drum: Brake drum resurfaced on a lathe too quickly, resulting in a friction surface similar to that of a scored drum.

Tire Rolling Radius: The distance, expressed in inches, from the center of a tire to the pavement, measured when mounted on a vehicle and loaded to its maximum capacity.

TMC: Maintenance Council

Turned Drum: A brake drum that has been resurfaced on a lathe to remove scoring or other defects.

Wedge Brake: As opposed to a brake applied by a s-cam, this type of brake is applied by a single or double wedge type mechanism. This type of brake is self-adjusting and, as such, does not utilize a slack adjuster.

XEM: Xtra Easy Maintenance, Fruehauf's term for brake design with an open anchor pin rib. This shoe will not interchange with Rockwell Q and Spicer FC shoes.

XtraLife: Spicer's term for a quick-change design brake shoe using thicker than standard lining. Available in both the original XtraLife design, and the new XtraLife II version.
